

Late booking amendments

A functional analysis for a fictional short-sea operator

Philippe Godfroy

Booking changes across portal, EDI and agents

Independent portfolio case study based on a fictional organisation. It contains no confidential information from any real employer or the hiring company. All figures are illustrative assumptions, not real company data.

The booking problem

The portal stops changes 24 hours early.

EDI overwrites bookings without shared checks.

Agents use remembered rules and spreadsheets.

The terminal may still show the old sailing.

Independent portfolio case study based on a fictional organisation. It contains no confidential information from any real employer or the hiring company. All figures are illustrative assumptions, not real company data.

Discovery and decisions

Simulated interviews expose contradictory cut-offs.

An event timeline makes disagreement visible.

The analyst prepares options and consequences.

Decision owners validate the business policy.

Independent portfolio case study based on a fictional organisation. It contains no confidential information from any real employer or the hiring company. All figures are illustrative assumptions, not real company data.

Deadline and execution

At exactly T-30, changes and approvals close.

Receipt time determines cut-off eligibility.

Current status, capacity and time control execution.

A timely request can arrive too late to execute.

Independent portfolio case study based on a fictional organisation. It contains no confidential information from any real employer or the hiring company. All figures are illustrative assumptions, not real company data.

Booking and delivery status

Applied means the booking commit succeeded.

The commit durably queues notifications.

Delivery can remain queued, retrying or failed.

Support replays and reconciles the notification.

Independent portfolio case study based on a fictional organisation. It contains no confidential information from any real employer or the hiring company. All figures are illustrative assumptions, not real company data.

Validation evidence

27 executable decision examples

43 automated checks in total

Approval guards and delivery-state separation

Planned integration tests and user acceptance

Independent portfolio case study based on a fictional organisation. It contains no confidential information from any real employer or the hiring company. All figures are illustrative assumptions, not real company data.

Pilot and measurement

Validate policies with operations and finance.

Pilot one route and selected EDI partners.

Train users and rehearse support recovery.

Measure incidents, channel mix and delivery failures.

Independent portfolio case study based on a fictional organisation. It contains no confidential information from any real employer or the hiring company. All figures are illustrative assumptions, not real company data.

What the case demonstrates

- Traceable specifications and design trade-offs
- Consistent rules across documents and examples
- An explicit boundary between proposals and proof
- Real stakeholder facilitation remains unproven.
