

Late booking amendments

Functional analysis - Tidewell Shortsea Lines (fictional)

Challenge

Portal, EDI and agents apply inconsistent sailing-change rules. The fictional operator needs one explainable policy, traceable requests and safe terminal coordination.

Approach

Simulated discovery and event storming inform 18 rules and 10 stories. Process, state and data models connect the same rules to interfaces, tests and support.

Review decisions

At exactly T-30, requests and approvals close. Receipt determines eligibility, while current time/status/capacity determine execution. Applied records the booking commit and durable notification enqueue, with delivery status separate.

Validation

27 executable decision examples plus 16 checks pass locally. The checker exposes boundaries and delayed processing. Real integration, concurrency, partner and UAT validation remain planned.

Delivery and value

Proposed pilot on one route with selected partners, user training, feature flag and support recovery. Illustrative targets: amendment incidents 6/month to 0, phone share 35% to below 10%, all fees backed by recorded Applied amendments. These are hypotheses, not results.

What this demonstrates

Functional specifications, design trade-offs and traceability. Interviews, workshop decisions and UAT are simulated. No production or stakeholder experience is claimed.

Open the case and rule checker

Independent portfolio case study based on a fictional organisation. It contains no confidential information from any real employer or the hiring company. All figures are illustrative assumptions, not real company data.
